Data Encryption

Sedra Solutions employs robust encryption methods to protect data both in transit and at rest. For data in transit, we utilize Transport Layer Security (TLS) 1.3. All data at rest is encrypted using AES-256 bit encryption. We also implement full-disk encryption on all company devices and servers to provide an additional layer of protection against physical theft or unauthorized access.

Privacy Controls

Sedra Solutions takes a multi-layered approach to protecting sensitive information. We start with the principle of least privilege, ensuring that Sedra personnel only have access to the data they need to perform their job functions. Data masking and tokenization techniques are used to protect sensitive data elements, particularly in non-production environments. Additionally, we provide ongoing security training to all personnel.

Regulatory Compliance

Ensuring compliance with data protection regulations is a top priority for our organization. We take a privacy-by-design approach and integrate privacy considerations into all our processes and systems from the ground up.

Our legal and compliance teams work closely with IT and security to stay abreast of regulatory requirements and implement necessary controls. We maintain detailed documentation of our data processing activities, conduct regular internal audits to assess compliance and engage third-party auditors for independent verification
